

**S5 Table. The effect of abortion restrictions on socioeconomic outcomes, triple differences, no controls.**

| Outcomes                         | Under35 × After ×<br>Y74 ( $\beta_7$ ) | Robust SE | p     |
|----------------------------------|--|-----------|-------|
| (1) University degree            | -0.098                                 | (0.039)   | 0.012 |
| (2) Primary education            | 0.113                                  | (0.077)   | 0.143 |
| (3) Years of education completed | -0.715                                 | (0.509)   | 0.161 |
| (4) Not having employment (ILO)  | 0.077                                  | (0.079)   | 0.332 |
| (5) Working                      | -0.042                                 | (0.080)   | 0.605 |
| (6) Unemployed                   | 0.093                                  | (0.058)   | 0.107 |
| (7) Teen parent                  | 0.053                                  | (0.038)   | 0.159 |
| (8) Owner of their residence     | -0.104                                 | (0.054)   | 0.054 |

Under35 × After × Y74 ( $\beta_7$ ) shows the effect of the restricted access to abortion that mothers under age 35 have compared to mothers over age 35 using a triple difference model with data from 1973 and 1974. The estimates come from Equation (2), but control variables are not included. Sample size: 2150. Mothers under age 35 at the time of conception were 33.88-35.38 years old when giving birth. Mothers over 35 at the time of conception were 35.77-37.27 years old when giving birth.
